# DOCUSHIELD AI

## Sample Investigation Dossier

**Team:** HACKNCODE | **Team Leader:** Parag Patel | **Members:** Dhruvi Dave, Dhruvansh Dave

**Dataset:** Synthetic demonstration records only

**Important:** This dossier demonstrates prototype output. Discrepancies are not proof of fraud.

# 1. Executive Summary

Three synthetic records were reviewed. The sample set contains an address mismatch between the application and supporting record, and an amount mismatch between the application and secondary record. These are flagged for human review.

# 2. Documents Reviewed

| Document | Extracted name | Address | Amount |
|---|---|---|---|
| sample_application.pdf | Aarav Mehta | 14 River View Road | 45000 |
| sample_supporting_record.pdf | Aarav Mehta | 41 River View Road | 45000 |
| sample_conflicting_record.pdf | Aarav Mehta | 14 River View Road | 54000 |

# 3. Findings

**F-01 — Address discrepancy:** The address differs between sample_application.pdf and sample_supporting_record.pdf. Status: Review required. Suggested action: inspect original records and verify with the issuing source.

**F-02 — Amount discrepancy:** The amount differs between sample_application.pdf (45000) and sample_conflicting_record.pdf (54000). Status: Review required. Suggested action: compare the original transaction/application evidence.

# 4. Evidence & Traceability

The running prototype calculates SHA-256 for each uploaded source file and includes the filename and digest in its downloadable JSON dossier. This static sample dossier does not contain hashes of the generated PDF files; hashes are calculated at runtime from the exact uploaded bytes.

# 5. Methodology

The prototype extracts embedded PDF text, applies transparent field patterns, and compares supported values across documents. It does not use a trained AI model or an external verification database.

# 6. Limitations & Analyst Review

Extraction may be incomplete or inaccurate. A mismatch can arise from legitimate updates, data-entry errors, or OCR mistakes. No finding should be treated as confirmed manipulation without independent verification. This sample is synthetic and must not be used for real decisions.
